

Cocktail Ordering Web Application

This dynamic web application streamlines the process of ordering cocktails through an intuitive and user-friendly interface. Users can browse a visually appealing catalog of available cocktails, each accompanied by an enticing image. By selecting a desired cocktail, they are directed to a dedicated recipe page that provides a concise description, detailed ingredients, and preparation instructions.

Built using PHP and XML, the application allows users to submit their orders through a well-structured web form, which is validated using HTML5 to ensure accuracy and usability. Submitted orders are seamlessly processed and displayed on the Orders.php page, where today's orders are prominently listed from most recent to oldest. Previous days' orders are organized beneath, providing a clear and accessible record of all submissions.

This seamless ordering experience is designed to enhance user interaction while maintaining robust functionality. Whether users want to explore new cocktail recipes or directly submit an order, the application offers an efficient and engaging solution.

ORDER

Order Sent, Coming Right Up!

1. Exploring Cocktails

- Users begin on the homepage, where they are presented with a curated selection of available cocktails.
 - Clicking on a cocktail image immediately redirects them to a dedicated recipe page.
2. Recipe Page & Ordering

- The recipe page showcases a visually appealing layout, featuring a brand-consistent design and color scheme.
 - Users can view the short description, recipe, and ingredients needed to craft the cocktail.
 - An order button, integrated within the cocktail's image, allows users to place an order.
3. Submitting an Order

- Clicking the order button opens a user-friendly order form, where customers enter their information.
 - Upon submission:
 - The order details, along with a timestamp, are stored as a session variable and uploaded to an XML document via PHP.
 - The form, along with the recipe and description, closes automatically.
 - A success message confirms the order submission.
 - After a brief delay, the user is redirected to the homepage for continued browsing.
4. Bartender Access

- Bartenders access the Orders.php page by navigating to /recipes/orders.php via the URL.
 - This page presents all submitted orders, with today's orders displayed first in reverse chronological order.
 - Behind the scenes, PHP accesses and organizes the XML data, ensuring an accurate and up-to-date display of customer requests.
- Project Directory:
